

## Applications for Electrical Impedance Spectroscopy Process Analytical Technology (EIS-PAT) in Lyophilization Process Development

**Prof. Geoff Smith**

School of Pharmacy, De Montfort University, Leicester LE1 9BH

# Overview

- System configuration: non-invasive measurements
- Electrical impedance and material attributes
- Methods for temperature calibration
  - Triangulation of thermocouple temperatures
  - Tempris
- LF and HF dielectric constant for
  - Nucleation temperature and solidification end point
  - Glass transition
  - Sublimation end point
- Dielectric loss peak
  - quantification of ice mass and drying rate
  - ice interface temperatures

# System configuration

a

b

## Junction box

# Non-invasive measurements

Individual vials

In process

# Electrical impedance and material attributes

## Liquid state (Maxwell-Wagner)

## Frozen state (dielectric relaxation)

# Electrical impedance and material attributes

## Maxwell-Wagner & ice relaxation

b

TVIS vial on cradle  
To be placed in the cryostat  
of **Novocontrol BDS**

# TVIS Applications

## Temperature Calibration

# 1. Triangulation method

Placing a thermocouple at the TVIS sensing node allows for the calibration of the temperature inside the TVIS vial to a precision of +/- 0.4 C  
(see next two slides)

## TC in nearest neighbour vial

# 1. Triangulation method

## Temperature uncertainty during freezing phase

TC3

## TC in nearest 3 neighbour vials

TC4

TC1

## Temperature calibration for the TVIS vial:

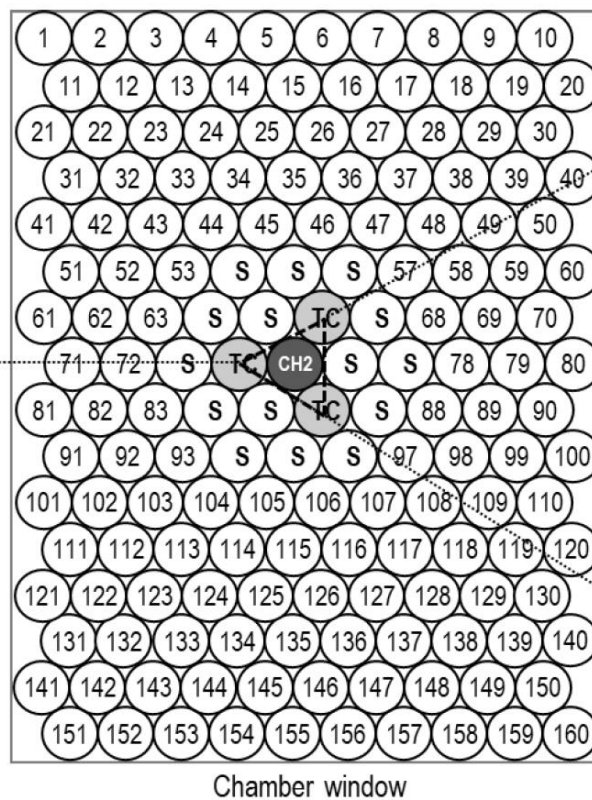

### 1. Triangulation method

## Temperature uncertainty during re-heating phase

TC3

## TC in nearest 3 neighbour vials

TC4

TC1

## 2. Tempris method

### TVIS spectra

# TVIS Applications

## *Nucleation temperature*

# Nucleation Temperature

- In case the TVIS vial nucleates before TC vial, the nucleation temperature in the TVIS vial can be inferred directly from TC temperatures in the nearest neighbor vials
- However, if TVIS vial nucleates later than TC vial, the nucleation temperature can be predicted by fitting a curve to the plot of the average temperature from thermocouple vials against TVIS parameter (i.e.  $C'(10\text{ Hz})$ )
- The ice nucleation temperature of sample (5 %w/v sucrose) was found to be  $-10.5\text{ }^{\circ}\text{C}$  in the case of this particular TVIS vial (other vials will differ owing to the stochastic nature of ice formation).

# Nucleation temperature

Solidification time / min

S-1 (0% NaCl)

S-2 (0.26% NaCl)

S-3 (0.55% NaCl)

# TVIS Applications

## *Solidification end point*

# Solidification period

## Ice nucleation

- The difference between these two times if the ice solidification time
- Knowing the height of the product in the vial one can then estimate an average solidification rate

## Solidification end point

$$\text{Average solidification rate } (R_{av}) = \frac{\text{Ice height } (L)}{\text{solidification time } \Delta t}$$

# Solidification end point 5% sucrose

Water

5%Sucrose

5%Sucrose in  
0.26% NaCl

5%Sucrose in  
0.55% NaCl

Solidification time for ice formation increases with the salt concentration

Examples

## TVIS Applications

*Determination of in-vial Glass Transition temperature ( $T'_g$ )*

# Glass Transition Temperature

Thermocouple position

## Annealing

Ramp from -50 °C to -10 °C with 0.2 /min

# $C'(0.2\text{ MHz})$ during Re-heating

5% Sucrose in  
0% NaCl

5% Sucrose in  
0.26% NaCl

5% Sucrose in  
0.55% NaCl

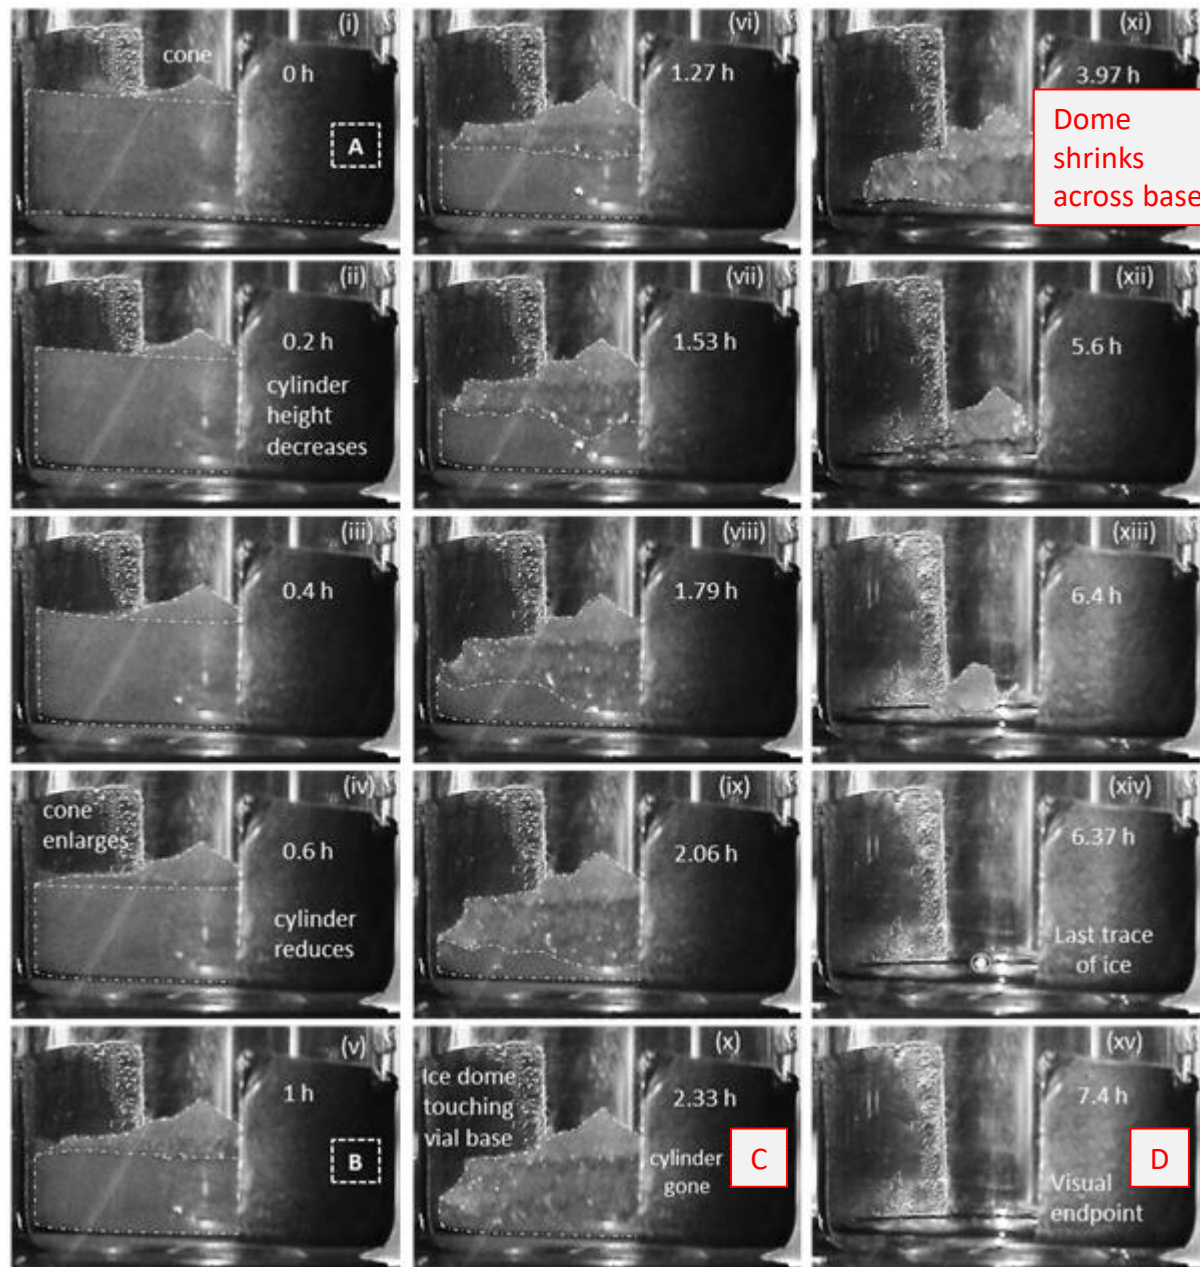

Onset of glass transition observed by the inflection in the temperature profile of the TVIS parameter  $C'(0.2\text{ MHz})$

# TVIS Applications

## *Sublimation end point*

# Sublimation end point

# Sublimation end point

# Primary drying

Product  
temperature

Sublimation  
rate

$K_v$

Primary  
drying  
endpoint

$R_p$

Collapse  
event

# Product temperature prediction

The product temperature predicted by TVIS can demonstrate the temperature gradient across ice cylinder height

# Drying Rate Estimation Pure ice

- Drying rate during the steady state

$$\text{Drying rate } \left( \frac{\Delta m}{\Delta t} \right) = \rho_i \cdot A \cdot \frac{h_{(t1)} - h_{(t2)}}{t_2 - t_1}$$

Ice density ( $\rho_i$ ) at  $-32^\circ\text{C}$  =  $0.920\text{ g}\cdot\text{cm}^{-3}$

(Calculated ice temperature between  $T_i$  &  $T_b$ )

Internal vial diameter (VC010-20C) =  $2.21\text{ cm}$

Cross-section area ( $A$ ) =  $3.80\text{ cm}^2$

Ice height at 2 h ( $h_{(2\text{ h})}$ ) =  $19.94\text{ mm}$

Ice height at 2.8 h ( $h_{(2.8\text{ h})}$ ) =  $18.98\text{ mm}$

TVIS parameters used for determination:

$$\frac{\Delta m}{\Delta t} = 0.42\text{ g}\cdot\text{h}^{-1}$$

$$T_b = -29.8^\circ\text{C}$$

$$\begin{aligned} \text{Drying rate} &= 0.920\text{ g}\cdot\text{cm}^{-3} \times 3.80\text{ cm}^2 \times \frac{(19.94 - 18.98) \times 10^{-1}\text{ cm}}{(2.8 - 2.0)\text{ h}} \\ &= \mathbf{0.42\text{ g}\cdot\text{h}^{-1}} \end{aligned}$$

| Parameters   | TVIS  |
|--|-------|
| Drying rate at steady state (g/h)<br>(2-2.8 h into primary drying) | 0.42  |
| Shelf Temperature, $T_s$ (K)                                       | 273.3 |
| Vial's base Temperature, $T_b$ (K)                                 | 243.3 |

$$L \frac{\Delta m}{\Delta t} = A_e K_v (T_s - T_b) \Rightarrow$$

$$K_v = \frac{L \frac{\Delta m}{\Delta t}}{A_e (T_s - T_b)}$$

$L$  is the latent heat of sublimation of ice (2844 J·g<sup>-1</sup> or 679.7 cal·g<sup>-1</sup>) and  $A_e$  is external cross-sectional area of the base of the TVIS vial (4.62 cm<sup>2</sup>)

$$K_v(270 \text{ bar}) = \frac{L \frac{\Delta m}{\Delta t}}{A_e (T_s - T_b)}$$

$$\begin{aligned}
 &= \frac{679.7 \text{ cal} \cdot \text{g}^{-1} \times 0.42 \text{ g} \cdot \text{h}^{-1}}{4.62 \text{ cm}^2 \times (273.3 - 243.3) \text{ K}} \\
 &= 2.06 \text{ cal} \cdot \text{h}^{-1} \cdot \text{cm}^{-2} \cdot \text{K}^{-1} \\
 &= 5.73 \times 10^{-4} \text{ cal} \cdot \text{s}^{-1} \cdot \text{cm}^{-2} \cdot \text{K}^{-1}
 \end{aligned}$$

$$K_v(270 \mu\text{bar}) = 5.73 \times 10^{-4} \text{ cal} \cdot \text{s}^{-1} \cdot \text{cm}^{-2} \cdot \text{K}^{-1}$$

# Summary

| Dielectric loss peak                 |   | Dielectric constant         |  |

# Appendix

# Electrical impedance and material properties

## Material properties contributing to the permittivity

### Electronic polarization (induced dipoles)

- Instantaneous relative to period of oscillating field

### Orientation polarization (fixed dipoles)

- Relative dependence on period of oscillating field
- Relaxation as frequency increases

## Material property:

Permittivity,  $\epsilon$   
(dielectric constant)

## Circuit element:

Capacitor,  $C$

$$C = \epsilon_0 \epsilon A / L$$

## Impedance:

Reactance,  $X_c$

$$X_c = 1 / \omega C$$

# Electrical impedance and material properties

## Material property:

Resistivity,  $\rho$

Conductivity,  $\sigma$

$$\sigma = 1/\rho$$

## Circuit element:

Resistor,  $R$

$$R = \rho L/A$$

Conductor,  $G$

$$G = \sigma A/L$$

## Impedance property:

Resistance,  $R$

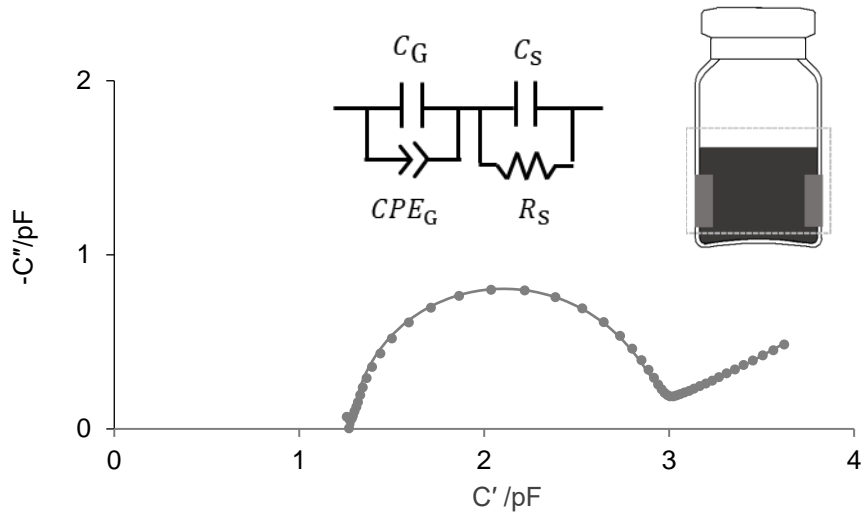

Metal ions, hydronium and hydroxide ions and ionised drugs in aqueous solution

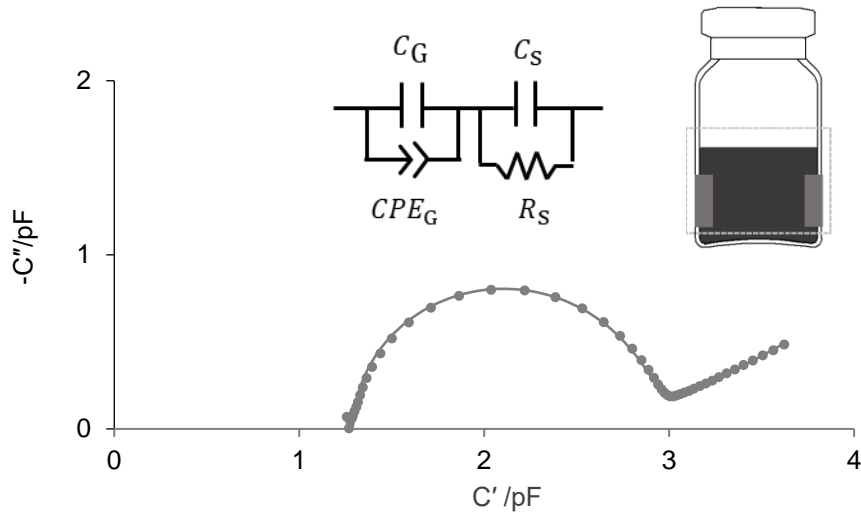

# Liquid state: glass wall controls low frequency response

# Liquid state: Charging of capacitances through solution

# Liquid state: MW loss peak

# Solidification end point

## Image analysis
